

IntroStatGPT: Homework Workflow

Keep the homework open while you work. The assignment tells you which output to generate and which questions to answer from it.

Work through one output panel

1. Start a new IntroStatGPT task for the **Generate output** panel.
2. Ask for the data, variables, table, plot, labels, and other specifications named in the panel. You may use the panel's wording, but you do not need to reproduce it word for word.
3. Inspect the result in the analysis page. Check the variables, groups, labels, units, and requested statistics or plot features.
4. Ask for a concrete correction if something is missing or hard to read. Use the short identifier shown with the output when you revise it.
5. Answer the questions immediately below the panel in your own words while the output is in front of you.

Repeat these steps for the next panel. A revision replaces the current version of an output. A fork keeps the current version and creates an additional one.

Build the Word report

1. Open the analysis organizer.
2. Select every required output and place the outputs under report headings in the same order as the homework. Include optional output only if you completed the optional work.
3. Ask IntroStatGPT to prepare the report. Review the displayed headings and output titles before you approve the report.
4. Build and download the Word report skeleton.
5. In Word, place each numbered response near the output it uses. The report should contain the generated output and your answers, not your chat prompts.
6. Export the completed Word report to PDF and submit the PDF.

If IntroStatGPT is unavailable

Use the report skeleton supplied with the homework. It contains known-good versions of the required tables and plots but no answers to the homework questions. Add your numbered responses in Word, then export the completed document to PDF. You may also use the supplied skeleton to check output you generated yourself.
